

# JoinedFriendAlert

*by Daniel Vogel.*

The JoinedFriendAlert App for iOS is the perfect addition to the Joined App. It works unobtrusive in the background and notifies you, when one of your Joined friends is close to you.

To use the app, you must have an Joined account. You can then login with your credentials. Afterwards you can see some settings and a list with all of your Joined friends and the current distance to the friends. The settings consist of two options. The first one is the alarm setting. You can activate the alarm by selecting a threshold distance. When the distance between one of your friends and your current location, gets below this value, the friend gets added to the "Close Friends" list. If the app is in the background, a local notification informs you about this issue. A refresh button at the upper right refreshes your friends list. The second option (the accuracy option) lets you specify your desired accuracy of the positioning. You can select a high precision positioning service using gps (best) or settle with coarse positioning (three kilometers). The second option uses the battery saving cell positioning.
